PREP-6C20F4A6F469739949D22A09

Record digest: 84862178ea638bef8213b406bcd6dbb276b42de5923073a84c30b9279278738a

Personal GitHub repository URL

https://github.com/miomio08/12A---Mio

Git test: edit → run/preview → save → commit → push → open remote. Record the test commit and result.

I added my personal GitHub link to the link section, it checked it and said that my repository is public. Then I selected my 12A repository and approved it. After that, I did a backup to ensure that it works. The evidence is my link, it works and it is public: https://github.com/miomio08/12A---Mio

Instructor access and team Git readiness: what did you test? Solo: say solo.

By selecting a specific repository, I ensured that Canvas has access to all my work on GitHub and it creates checkpoints for me. Public VIEW code: VIEW-1D0EE6618FF85176E000F76F

1 · Introduction — scan notes, one useful idea and one question

Pathway to Pipelines: intro

First vid focuses on mindset: why is it important, common obstacles in game development/how to overcome, how to stay motivated/focused
My thoughts: I believe that mindset is important for game development because its essentially the deciding factor of where your game goes, if you have a clear idea and a certain thought about a project, like a pipeline, it is be easier for you to complete your work.

Second is on setup folder project: why is it important, how to create a folder structure to match your needs, essential folders, how to organize assets and scrips
My thoughts: Organizing folders, especially for bigger projects is super important, this is honestly something I struggle with so learning more about that would be helpful.

Third is abt documentation: why is it important, essential documents that you should have, how to create a game development document, how to maintain documentation
My thoughts: Documentation is something I am very keen about, this is because of a IB film class I took in high school, all throughout the year I was told to document every single thing I do, even if its something small, because then it could serve as evidence and that is something that is just imprinted in my mind.

Fourth and final: assets & resources: downloading assets, IDE, text editors, photo editors and 3D editors, where to find assets, how to download resources, what resources are best, and how to use them effectively
My thoughts: I don't know a lot about game development or assets and the other resources mentioned, however, I am interested in knowing more.

Question(s) I have from this introduction vid:
1. How can I stay organized effectively?
2. If a folder is copied and moved, but the system creating it doesn't recognize that change, even if you reopen the new folder, how do you undo this?

2 · Developer mindset — scan notes, one useful idea and one question

- Having the right mindset is essential for game development (I wrote down main ideas then took notes on what I think they mean)
Point 1. "Why is mindset important for game development?" notes:
'-> Creativity and innovation: the key to game development
'-> Perseverance: game development is a long process, it is important to stay focused and work towards your goal
'-> Adaptability: things are always advancing, it is important to keep up
'-> Collaboration: game development is not a single process, even if you work alone on creating, you are still using assets from someone else
'-> Customer focus: stay focused on what YOU want to deliver, what audience your making it for, what your players want, that is what leads to success
My conclusion: Staying relevant and focused, while keeping a positive mindset is what leads to a successful game.

Point 2. "How to develop a growth mindset?" notes:
'-> Changing the way you think, you have to keep growing throughout the entire process of game development in order to reach your potential
'-> Embrace challenges: seek out challenges because they are opportunities to grow
'-> Learn from failure: failure teaches you how to do things differently and learn what you did wrong in order to fix the mistake in the future
'-> Focus on effort: have the mindset that your hard work and effort will pay off
'-> Be open to feedback: feedback is what will give you insight of what others think, giving you room to be criticized so you can improve
'-> Surround yourself with positive role models: find people who inspire you and you can look up to so you have motivation to keep going
'-> Keep learning: you will always have to keep learning in life, and in game development, you will never know everything and learning more also relates to having the open mindset

Point 3. "What are the common obstacles in game development, and how to overcome them?" notes:
'-> Technical challenges: you will run into issues with sound design or programming, etc., but it is important that you have a team with different technical skills that could help you and to have crisis plans
'-> Scope creep: it is easy to get carried away in game development, it is important to stay focused
Scope creep=getting carried away from the scope of the game, adding a bunch of different things and features to the original plan.
'-> Marketing and distribution: a part of creating a game is having an idea of how you will present it to your audience
'-> Funding: can be an issue because not everyone will have funding, it is important to have a clear business pitch
'-> Burnout and mental health: game development can be very demanding on your mental health and effort, it is important to take time for yourself as well and to take a lil break if you feel overwhelmed

Point 4. "How to stay motivated and focused during the game development process?" notes:
'-> Set clear goals list: it will motivate you to achieve goals as you go through the process and help you stay

focused on your tasks
'-> Celebrate small wins: again, celebrating the smaller accomplishments will help you feel happier in general and more motivated
'-> Take breaks: important that you don't overwhelm yourself and experience burnout, burnout will also just make you dislike the process of game development
'-> Stay organized: keep things in order and document everything in appropriate folders to find them easier
'-> Stay passionate: if you are happy and excited to work on a project, you will actually WANT to do it, remember what you are doing it for
'-> Collaborate and communicate!!!: EXTREMELY IMPORTANT because it can help you enhance everything in your project, it gives you other opinions and ideas and insights which helps you grow and change things and eventually get a better project

Question I have:
1. Where do you find the people to pitch ideas to??

3 · Folders and project creation — scan notes, one useful idea and one question

Why developing a solid folder structure is so important: (main ideas and my summary):
- Its important because it makes managing your project a lot easier
'-> Easier for new people to see your project and understand it and makes it easier for you to manage every asset

Put thought into file structure, what you'll name files, etc.
'-> Make a folder with project name
'-> First file you'd wanna make is the .txt file for logs, give it a title: adds a date every time you open it, logs your info and helps you keep track. divide with borders to keep organized
'-> Use Talstra folder maker, the newer version is much better and easier to use
'-> Use parent-child structure to stay organized
'-> Create ReadMe file
'-> Create links/resources file

Question I have:
1. Does Talstra comes with templates? I saw the link and saw templates on it, not sure what that is.

4 · Documentation — scan notes, one useful idea and one question

Documentation: using Talstra: notes
'-> In your folders, you should have a website looking page you can edit in order to track your progress, goals, and overview.
'-> Should have deadlines, schedules, etc.
'-> Documenting things throughout the process will one, give you evidence of your work, two, give you clear tasks to complete, and three, motivate you to finish your goals
'-> Documentation also helps you stay organized when creating your game
'-> Save your documentation in your appropriate project folder
'-> Overview: helps not only yourself but others also understand your project and find it easier to understand

5 · Introduction to Unity — scan notes, one useful idea and one question

Intro to Unity: notes:
'-> Open Unity using 2021.3.21f1, give it a project, and pick a location (in your project folder) then hit select, also pick the type of game you want to make (2D, 3D, etc.)
'-> Copy and move your project folder and put it into a your personal disk
'-> Copy that new folder address into Unity, change it's location then press create
'-> Unity opens with description on the side
'-> Left side has hierarchy with all your in-game assets
'-> You can click on scene and game to see the different views
'-> When you click on something, it shows you what it is made of and you can edit it through there
'-> Bottom of the screen has assets with every element in your game, you can move their location and just edit files from there

What I learned: How to import elements into Unity and how to get the basic starting point

6 · Import a custom player — scan notes, one useful idea and one question

Import custom player: notes:
'-> In documentation, you should have the link to your 3d characters and where to download it
'-> Mixamo has characters you can download, you can view them or see how their animation works
'-> How to upload: drag character file into Unity
'-> Delete character folder, and instead put the character into assets
'-> Use Talstra

What I learned: I learned how to add characters into Unity and actually make them move around, I learned how to add different elements such as 3d shapes and how to move them around and change their color. I also learned more about how to manage files on unity and about Mixamo.

Your interpretation: what can this pipeline contribute to a prior or new story?

Based on all the information I learned, I would connect this to when I make my own game. This pipeline can help me create a new story because I now know where to get started when it comes to game development. I know how to use the basic functions of Unity and also how to create folders, logs, and document the process according. If I were to create a game of my own, this information would help me get started and I can continue learning from that point, because growing while going through the game development is a part of the mindset you should have in order to be successful.

Questions to resolve before committing to a team or mission

"If a folder is copied and moved, but the system creating it doesn't recognize that change, even if you reopen the new folder, how do you undo this?" is a question I had because I accidently did this on an assignment before and had to redo my work on the new folder. But other then technical questions, a question I have regarding teamwork that I would ask someone is: their motivations and how much effort they put into the work, and how they believe that they provide something valuable.
