CS110 / INDEPENDENCE ROAD

Working draft not an issued form / Mio Bal

Issued: Nov 12, 2026, 3:40 PM Pacific

Record: WORKING-DRAFT

Personal public verification code: VIEW-1D0EE6618FF85176E000F76F

Include your own public code with every assignment, even in a team folder. Never submit your private recovery key.

SHA-256: Not issued. No authentication number. Create the numbered forms in the assignment.

Verify the record number at courses.addp2p.com/development-road/independence/index.html?view=verify

An issued record preserves submitted information. It is not a grade or proof of comprehension.

prep

repo

https://github.com/miomio08/12A---Mio

gitTest

I added my personal GitHub link to the link section, it checked it and said that my repository is public. Then I selected my 12A repository and approved it. After that, I did a backup to ensure that it works. The evidence is my link, it works and it is public: https://github.com/miomio08/12A---Mio

access

By selecting a specific repository, I ensured that Canvas has access to all my work on GitHub and it creates checkpoints for me. Public VIEW code: VIEW-1D0EE6618FF85176E000F76F

video1

Pathway to Pipelines: intro

First vid focuses on mindset: why is it important, common obstacles in game development/how to overcome, how to stay motivated/focused

My thoughts: I believe that mindset is important for game development because its essentially the deciding factor of where your game goes, if you have a clear idea and a certain thought about a project, like a pipeline, it is be easier for you to complete your work.

Second is on setup folder project: why is it important, how to create a folder structure to match your needs, essential folders, how to organize assets and scrips

My thoughts: Organizing folders, especially for bigger projects is super important, this is honestly something I struggle with so learning more about that would be helpful.

Third is abt documentation: why is it important, essential documents that you should have, how to create a game development document, how to maintain documentation

My thoughts: Documentation is something I am very keen about, this is because of a IB film class I took in high school, all throughout the year I was told to document every single thing I do, even if its something small, because then it could serve as evidence and that is something that is just imprinted in my mind.

Fourth and final: assets & resources: downloading assets, IDE, text editors, photo editors and 3D editors, where to find assets, how to download resources, what resources are best, and how to use them effectively

CS110 / INDEPENDENCE ROAD

My thoughts: I don't know a lot about game development or assets and the other resources mentioned, however, I am interested in knowing more.

Question(s) I have from this introduction vid:

1. How can I stay organized effectively?

2. If a folder is copied and moved, but the system creating it doesn't recognize that change, even if you reopen the new folder, how do you undo this?

video2

- Having the right mindset is essential for game development (I wrote down main ideas then took notes on what I think they mean)

Point 1. "Why is mindset important for game development?" notes:

'-> Creativity and innovation: the key to game development

'-> Perseverance: game development is a long process, it is important to stay focused and work towards your goal

'-> Adaptability: things are always advancing, it is important to keep up

'-> Collaboration: game development is not a single process, even if you work alone on creating, you are still using assets from someone else

'-> Customer focus: stay focused on what YOU want to deliver, what audience your making it for, what your players want, that is what leads to success

My conclusion: Staying relevant and focused, while keeping a positive mindset is what leads to a successful game.

Point 2. "How to develop a growth mindset?" notes:

'-> Changing the way you think, you have to keep growing throughout the entire process of game development in order to reach your potential

'-> Embrace challenges: seek out challenges because they are opportunities to grow

'-> Learn from failure: failure teaches you how to do things differently and learn what you did wrong in order to fix the mistake in the future

'-> Focus on effort: have the mindset that your hard work and effort will pay off

'-> Be open to feedback: feedback is what will give you insight of what others think, giving you room to be criticized so you can improve

'-> Surround yourself with positive role models: find people who inspire you and you can look up to so you have motivation to keep going

'-> Keep learning: you will always have to keep learning in life, and in game development, you will never know everything and learning more also relates to having the open mindset

Point 3. "What are the common obstacles in game development, and how to overcome them?" notes:

'-> Technical challenges: you will run into issues with sound design or programming, etc., but it is important that you have a team with different technical skills that could help you and to have crisis plans

'-> Scope creep: it is easy to get carried away in game development, it is important to stay focused

Scope creep=getting carried away from the scope of the game, adding a bunch of different things and features to the original plan.

'-> Marketing and distribution: a part of creating a game is having an idea of how you will present it to your audience

'-> Funding: can be an issue because not everyone will have funding, it is important to have a clear business pitch

'-> Burnout and mental health: game development can be very demanding on your mental health and effort, it is important to take time for yourself as well and to take a lil break if you feel overwhelmed

Point 4. "How to stay motivated and focused during the game development process?" notes:

'-> Set clear goals list: it will motivate you to achieve goals as you go through the process and help you stay focused on your tasks

'-> Celebrate small wins: again, celebrating the smaller accomplishments will help you feel happier in general and more motivated

'-> Take breaks: important that you don't overwhelm yourself and experience burnout, burnout will also just make you dislike the process of game development

'-> Stay organized: keep things in order and document everything in appropriate folders to find them easier

'-> Stay passionate: if you are happy and excited to work on a project, you will actually WANT to do it, remember what you are doing it for

'-> Collaborate and communicate!!!: EXTREMELY IMPORTANT because it can help you enhance everything in your project, it gives you other opinions and ideas and insights which helps you grow and change things and eventually get a better project

Question I have:

1. Where do you find the people to pitch ideas to??

video3

Why developing a solid folder structure is so important: (main ideas and my summary):

- Its important because it makes managing your project a lot easier

'-> Easier for new people to see your project and understand it and makes it easier for you to manage every asset

Put thought into file structure, what you'll name files, etc.

'-> Make a folder with project name

'-> First file you'd wanna make is the .txt file for logs, give it a title: adds a date every time you open it, logs your info and helps you keep track. divide with borders to keep organized

'-> Use Talstra folder maker, the newer version is much better and easier to use

'-> Use parent-child structure to stay organized

'-> Create ReadMe file

'-> Create links/resources file

Question I have:

1. Does Talstra comes with templates? I saw the link and saw templates on it, not sure what that is.

video4

Documentation: using Talstra: notes

CS110 / INDEPENDENCE ROAD

'-> In your folders, you should have a website looking page you can edit in order to track your progress, goals, and overview.

'-> Should have deadlines, schedules, etc.

'-> Documenting things throughout the process will one, give you evidence of your work, two, give you clear tasks to complete, and three, motivate you to finish your goals

'-> Documentation also helps you stay organized when creating your game

'-> Save your documentation in your appropriate project folder

'-> Overview: helps not only yourself but others also understand your project and find it easier to understand

video5

Intro to Unity: notes:

'-> Open Unity using 2021.3.21f1, give it a project, and pick a location (in your project folder) then hit select, also pick the type of game you want to make (2D, 3D, etc.)

'-> Copy and move your project folder and put it into a your personal disk

'-> Copy that new folder address into Unity, change it's location then press create

'-> Unity opens with description on the side

'-> Left side has hierarchy with all your in-game assets

'-> You can click on scene and game to see the different views

'-> When you click on something, it shows you what it is made of and you can edit it through there

'-> Bottom of the screen has assets with every element in your game, you can move their location and just edit files from there

What I learned: How to import elements into Unity and how to get the basic starting point

video6

Import custom player: notes:

'-> In documentation, you should have the link to your 3d characters and where to download it

'-> Mixamo has characters you can download, you can view them or see how their animation works

'-> How to upload: drag character file into Unity

'-> Delete character folder, and instead put the character into assets

'-> Use Talstra

What I learned: I learned how to add characters into Unity and actually make them move around, I learned how to add different elements such as 3d shapes and how to move them around and change their color. I also learned more about how to manage files on unity and about Mixamo.

opinion

Based on all the information I learned, I would connect this to when I make my own game. This pipeline can help me create a new story because I now know where to get started when it comes to game development. I know how to use the basic functions of Unity and also how to create folders, logs, and document the process according. If I were to create a game of my own, this information would help me get started and I can continue learning from that point, because growing while going through the game development is a part of the mindset you should have in order to be

successful.

questions

"If a folder is copied and moved, but the system creating it doesn't recognize that change, even if you reopen the new folder, how do you undo this?" is a question I had because I accidently did this on an assignment before and had to redo my work on the new folder. But other then technical questions, a question I have regarding teamwork that I would ask someone is: their motivations and how much effort they put into the work, and how they believe that they provide something valuable.

currentPage

57

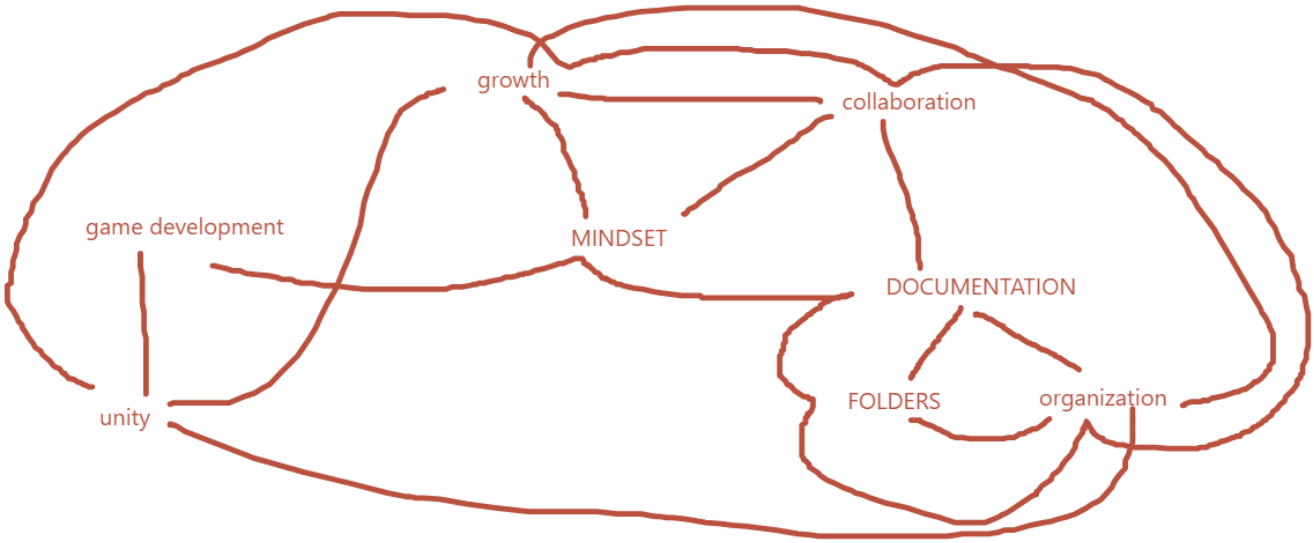

Whiteboard

Everything starts with mindset: it is what gets you started and working, that relates to growth and collaboration because that's what you have to do

game development is the main process so it relates to everything mentioned

documentation and folders both relate to collaboration and organization because they help you stay focused

Unity is connect to game development and growth because you learn new features as you go on

pitch

understand

What I understood about the work today is that it takes collaboration and determination, along with many other things in order to create games. So the expectations I have moving forward from myself and my team is that we will stay organized with our folders and documents, we will create separate tasks and deadlines to get our work done efficiently. And we will do our best to keep learning. The finish line should give us a sense of achievement and everyone should feel fulfilled with the work we've created.

offer

I will bring my creativity and motivation to my team. I personally believe that I am a creative person who comes up

with a lot of ideas while brainstorming, I also go off of others opinions. I also enjoy formatting and working with visuals so I also provide that to the team. I want to be someone who will keep everyone else on task, while also completing my own work. For example, if we are working on code for a website, and we assign different roles to everyone, I will make sure the buttons look good, manage the colors and come up with ideas as to what we need to include.

limits

Something that I would need to research and don't feel entirely comfortable with is coding. I struggle with this the most so I will be looking forward to learning more about it and to getting help from my teammates who know more about it than I do.

availability

2026-11-10 12:30 16:00 Pacific

2026-11-10 18:30 23:59 Pacific

Preferred contact: Text

Reach me on Instagram, it's what I use the most.

tools

Tools I need include Visual Studio and GoDot/Unity. Visual Studio is what I am most comfortable with using because we worked with it in class. I can use it to make the example website I was talking about. And, I want to learn more about Unity because it is something I am interested in and I feel that it would be useful to know about in this course.

aiTool

AI: ChatGPT

Task: This AI will help us create task-lists, and assist us if we are stuck in certain steps of a project where the whole team doesn't know what to do. This could be helping with generating code or correcting certain code.

Verification: I will verify the output by discussing it with my team. For the code, I will put it into my system and run it to see if it actually functions the way I want it to.

Background: Learn the lore from both source materials (Minecraft and Poke mon). Build the world of Minecraft, a free roam where the main character is a combination of Ash and Steve.

Assets: Assets: Getting the elements that will be edited and used in the creation of the mod: - Characters, text, animation, 3d models, fonts, audio, etc. Obtaining everything that will be used in order to achieve the results, aka also the things the audience will view.

Body Frame: Build/configure: Put the blocky world together, add an Ash-Steve character so he can walk around, and set up the basic controls for throwing Poke balls and catching Poke mon as well of building like in a Minecraft world.

CS110 / INDEPENDENCE ROAD

The output is for are mod to allow the player/consumer to be able to throw a poke ball to a Minecraft mob it will also make a custom world when loaded for the player with bits of Poke mon while still looking like Minecraft.

Results: Results - We have achieved the results we wanted. We wanted to make a mod pack for the video game Minecraft where we added a poke-ball from Poke mon.

tech

As a team we have chosen to use unity as the main engine for our game because of our knowledge in C#. We are also going to be using Unity Hub and Package manager. We chose this because based on the lesson videos we saw, we learned a few things about characters and how to create a functioning game, so we have information to get started. Additionally, it is also because we felt that it would be easiest to work with.

Time code

Classes & components

Class | Responsibility | GameObject

pokeballitem | Allows players to throw poke balls | Poke Ball

PokeballProjectille | Handles Poke Ball throwing and collision | Projectile

MobCaptureSystem | Detects and captures Minecraft mobs | Minecraft Mob

PokemonCompanion | Handles captured Poke mon companions | Pokemon Entity

PokemonWorldGenerator | Generates Poke mon-inspired terrain | Minecraft World

Variables / properties

Name : type | Value / purpose | Used by

pokeBallCount : int | Number of Poke Balls the player has | PokeBallItem

captureChance : float | Determines the chance of capturing a mob | MobCaptureSystem

targetMob : Entity | Stores the Minecraft mob being targeted | PokeBallProjectile

isCaptured : boolean | Checks whether a mob has been captured | MobCaptureSystem

pokemonName : String | Stores the captured Poke mon's name | PokemonCompanion

reuse

We can reuse the organization patters we are learning/learned from the 6 videos we saw on game development using Unity and Talsta. We can also reuse the story element to build upon what we have and use the skills we have learned to revise our work. We can also continue to further use AI to keep us on track and add new ideas.

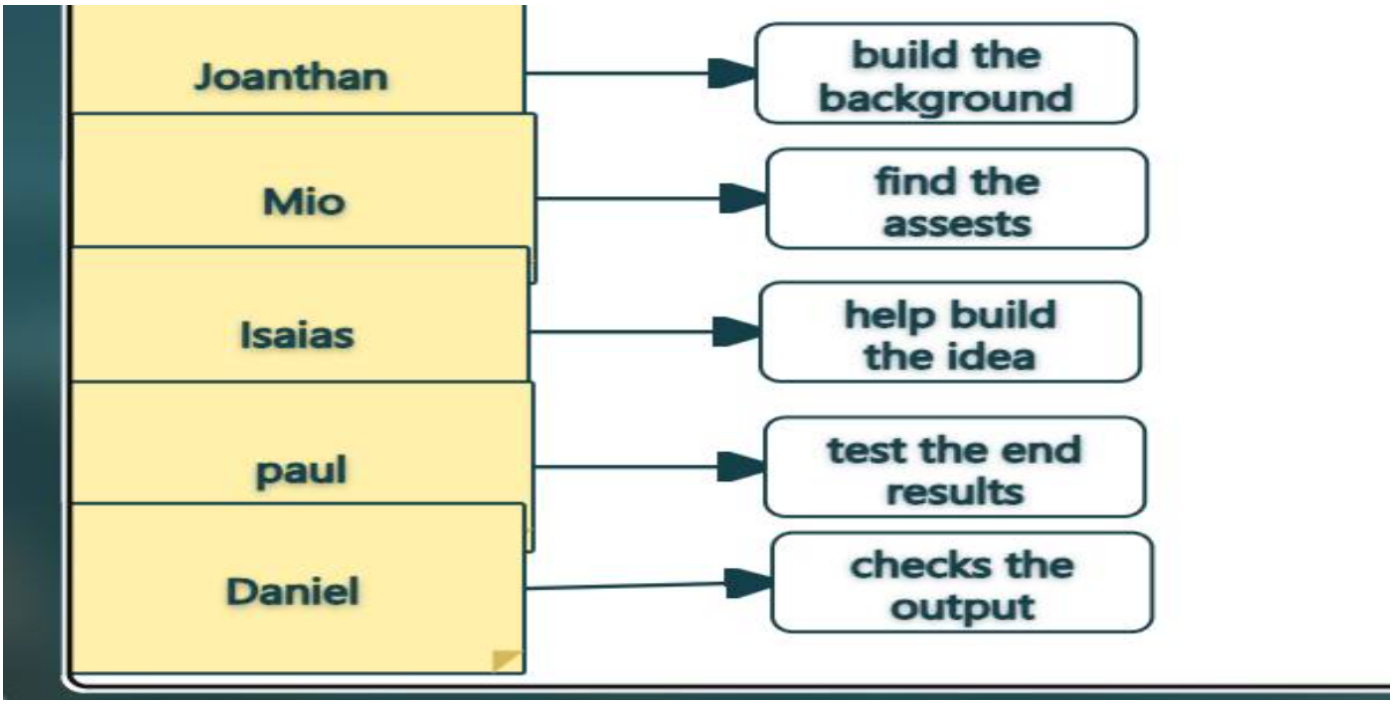

boardNotes

We all had planned to call over Zoom, however, we ran into technical difficulties so we decided to switch to Discord instead. We were on a call for over 2 hours working out our goals and coming up with ideas for our creation. We talked about what elements we want to include in our game, and we also created task boards to help us stay organized. We gave each other different jobs so we can work on separate things, we also discussed how we will be moving forward from this point on as a team.

reportA

checkpoint

Today, my team and I accomplished the foundation of our game development project. We decided on a plan/came up with what we want to create. We assigned tasks to each member and came up with a schedule that will keep us on track and ensure that we are all communicating throughout the entire process. We did the beginning stage, and now

CS110 / INDEPENDENCE ROAD

we need to continue to discuss what we want to do next and how we will achieve our goal.

evidence

https://github.com/miomio08/12A---Mio

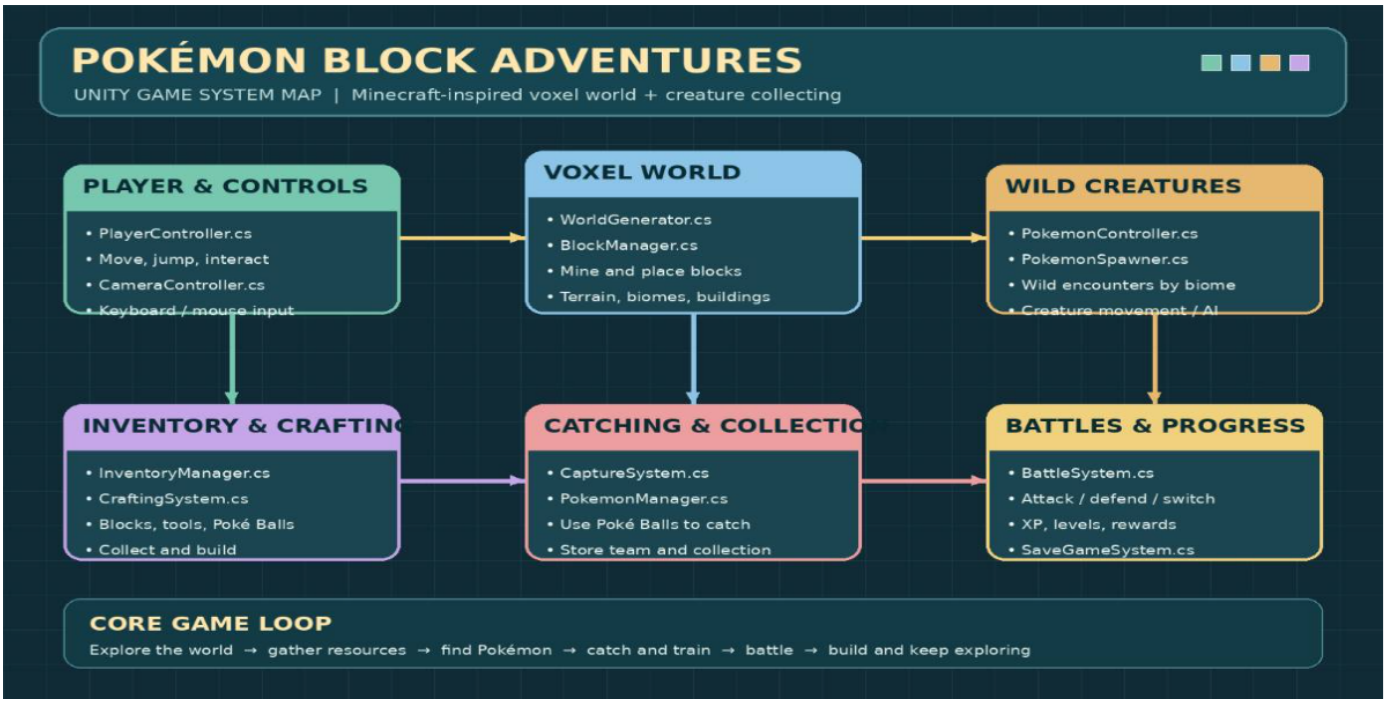

I saved the pdf of our work and saved it to my github.

next

My next task is by tomorrow, find the assets our game will need, especially the character that the player will play as.

Whiteboard

plan

dayBReview

recap

What I understand is that I am responsible for the assets in our project. My job is to find and download the 3d models we will be using. Something I need to clarify is how I will be getting our assets, or from where.

goal

true

owners

true

blockers

true

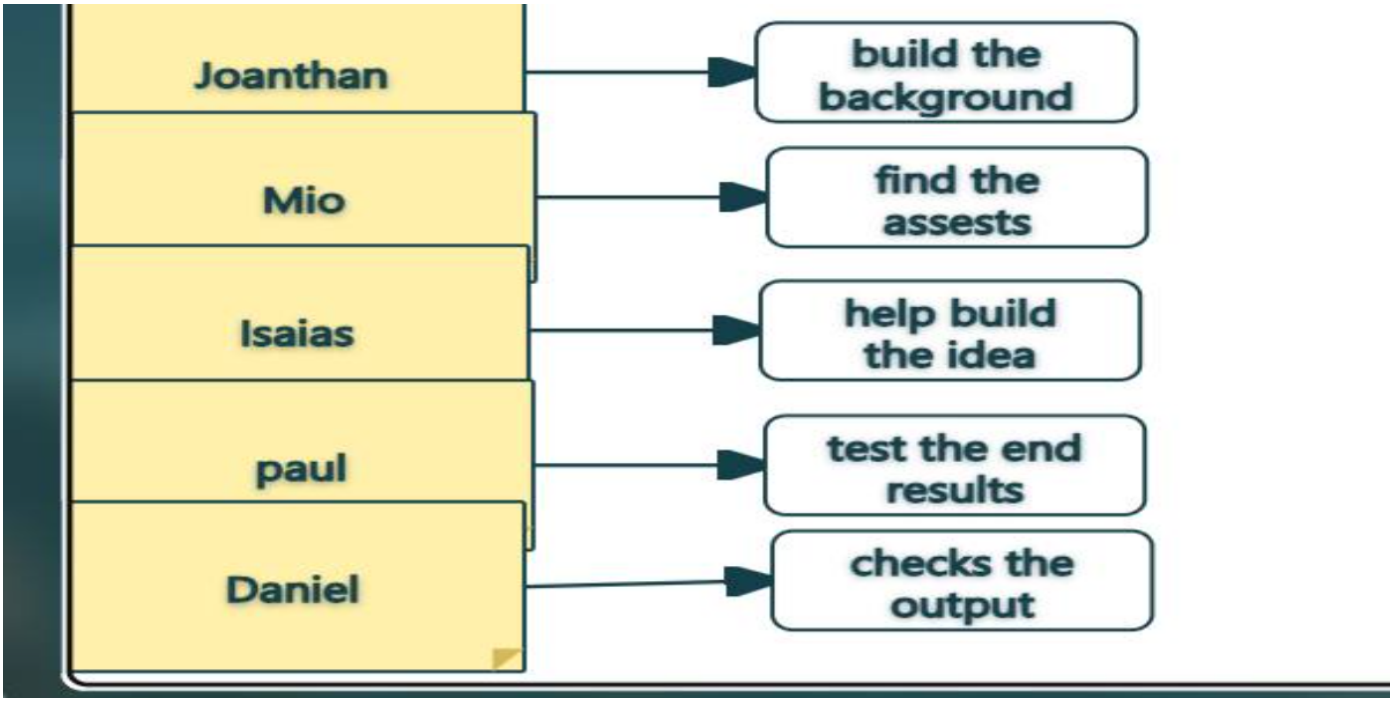

notes

What needs more attention: Time management

We are going to start with Unity

Whiteboard

this diagram explains are teams jobs/roles that they will finish up and have done before the end of class

taskResults

beb67b75-0e4d-4bf1-84bf-f4ae0e218857

Execution / result

I downloaded a 3d model of steve from minecraft, then I downloaded a png texture pack of ash. I added the model into blender then imported the skin. It was messed up and blurry so I added each texture onto each limb. Then I saved that and exported it into Unity, however, it was still blurred so I changed the filter mode and compression and saved that and it was fixed.

Completed

true

reportB

execution

I downloaded a 3d model of our character base, then I also downloaded a png of our texture that we would add onto the model. I imported both into blender, it added the texture onto the model but it was messed up and not in the right spots so I manually fixed each part of the character. Then I saved that and added it into Unity, the texture was blurry in there so I fixed that as well.

tests

I built the 3d model the player will use and actually play as. I ran into some difficulties but I was able to fix the textures and add it onto my model. I was able to fix certain issues by changing around the texture settings.

handoff

https://github.com/miomio08/12A---Mio

reflection

We successfully found our 3d models, however, there is still more work to be done because I need to still configure out pokeballs 3d model. That is something that is left, also just added all elements together to create one project. Next, we will figure out how to combine all of the things we worked on individually together into one Unity project.
